Titel: CORDLESS TELEPHONE EQUIPMENT WITH AUTOMATIC ANSWERING
TELEPHONE FUNCTION

Zusammenfassung

PROBLEM TO BE SOLVED: To eliminate a need of setting the time again without adding a special backup means even in the case of the occurrence of a power failure with respect to a timestamp function of a cordless telephone equipment provided with an automatic answering telephone function.

SOLUTION: A master machine 2 is provided with a power failure detection part 9, which detects the occurrence of a power failure, a time counting part 8 which counts the time, and a flash memory 7 where business messages are stored, and a slave machine 15 is provided with a time counting part 25 which counts the time by the indication of the master machine. If the occurrence of a power failure is detected by the power failure detection part 9 of the master machine 2, the occurrence of the power failure and time data of the time counting part 8 at this time are transmitted to the slave machine 15, and the time counting part 25 of the slave machine 15 starts counting based on this data, and the time counting part 8 of the master machine 2 is set to data in the time counting part 25 of the slave machine again at the time of restoration from the power failure.
